

KAOS — Development Roadmap

Project Identity

KAOS is planned as:

- a Linux-based operating system
- a custom desktop platform
- a modular ecosystem
- a modern user-focused environment
- a performance-oriented distribution

The project focus is not low-level kernel development.

The focus is:

- user experience
 - desktop environment design
 - ecosystem development
 - system integration
 - workflow optimization
 - native applications
 - branding and platform identity
-

Stage 1 — Foundation

Initial project setup and infrastructure.

Main focus areas:

- repository organization
- build environment
- Linux base selection
- automated ISO generation
- development tooling
- CI/CD infrastructure
- branding direction

Deliverable:

- first bootable KAOS prototype
-

Stage 2 — Base System Architecture

Creation of the core KAOS Linux environment.

Main focus areas:

- package structure
- filesystem layout
- update system
- configuration management
- release pipeline
- distribution identity

Deliverable:

- reproducible KAOS base system
-

Stage 3 — Desktop Environment Development

Development of the main KAOS desktop experience.

Main focus areas:

- Wayland compositor
- window management
- workspace system
- panel system
- notification framework
- theming engine
- animation framework
- session management

Deliverable:

- functional KAOS desktop session
-

Stage 4 — Core User Experience

Development of the primary interaction systems.

Main focus areas:

- launcher system
- application management
- search integration
- quick settings
- multitasking workflow
- keyboard shortcut framework
- accessibility systems
- customization tools

Deliverable:

- polished user workflow environment
-

Stage 5 — Native Application Ecosystem

Creation of core KAOS applications.

Main focus areas:

- terminal application
- file manager
- settings application
- software center
- system monitor
- media applications
- developer tools
- update manager

Deliverable:

- complete native application suite
-

Stage 6 — Package and Distribution Ecosystem

Expansion of the software ecosystem.

Main focus areas:

- package repositories
- application distribution
- Flatpak integration

- package management layer
- update infrastructure
- developer SDK
- repository hosting

Deliverable:

- maintainable software ecosystem
-

Stage 7 — Installation and Deployment

Creation of deployment and installation systems.

Main focus areas:

- graphical installer
- hardware detection
- partition management
- recovery environment
- live environment
- system migration tools

Deliverable:

- user-installable KAOS release
-

Stage 8 — Hardware Integration

Improvement of hardware compatibility and integration.

Main focus areas:

- GPU optimization
- networking integration
- Bluetooth support
- peripheral support
- laptop optimization
- power management
- audio integration

Deliverable:

- stable daily-driver hardware support

Stage 9 — Security and Stability

System hardening and platform reliability.

Main focus areas:

- sandboxing
- permissions management
- secure updates
- process isolation
- rollback systems
- backup systems
- recovery tools

Deliverable:

- stable and secure platform foundation
-

Stage 10 — Performance Optimization

Optimization of responsiveness and efficiency.

Main focus areas:

- startup optimization
- memory optimization
- graphics performance
- animation pipeline
- background service optimization
- package caching
- compositor optimization

Deliverable:

- highly responsive desktop environment
-

Stage 11 — Ecosystem Expansion

Growth of the KAOS platform beyond the base OS.

Main focus areas:

- plugin systems
- developer APIs
- cloud integration
- synchronization services
- theme ecosystem
- extension marketplace
- documentation platform

Deliverable:

- extensible operating system ecosystem
-

Stage 12 — Public Release Strategy

Preparation for wider adoption.

Main focus areas:

- alpha testing
- beta testing
- community infrastructure
- issue tracking
- documentation
- release management
- update channels

Deliverable:

- public stable release
-

Long-Term Vision

KAOS should eventually evolve into:

- a recognizable Linux platform
- a visually distinct operating system
- a productivity-focused environment
- a developer-friendly ecosystem
- a modular desktop architecture
- a scalable application platform
- a polished and modern user experience

The long-term identity of KAOS should come from:

- desktop experience
- workflow design
- ecosystem quality
- responsiveness
- visual identity
- integration quality
- native software
- platform consistency
